

RIGUER flow

RHIZOSPHERE EQUALIZER

balance

Improves soil-root balance

Reduces salinity, water and heat stress

Activates roots and improves nutrient uptake

Optimises water and nutrients

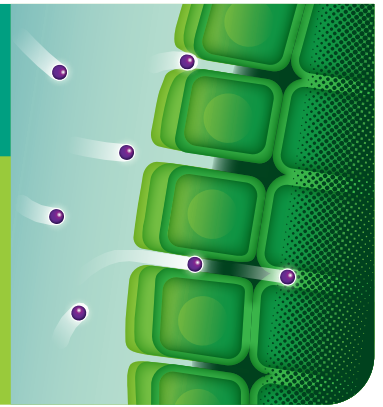

Increases size, quality and yield

BIACTIVE LINE

An exclusive formulation developed by Seipasa, based on **BI ACTIVE-NATURAL TECHNOLOGY**

- » Optimal dissolving.
- » Reduction of the active molecule size, facilitating its absorption by plants.
- » Liquid, easy to handle and safe for the person applying it.

How it works

- ⊗ Helps improve soil structure.
- ⊗ Promotes the division and differentiation of cells in new tissues.
- ⊗ Maintains plant structures in perfect conditions.

Benefits

- Enhances soil nutrient availability.
- Boosts root development processes.
- Aids evapotranspiration mechanisms.
- Combats water and saline stress in sensitive soils.
- Improves water efficiency in soil.
- Prevents stress suffered by fruits due to high temperatures and radiation.
- Improves crop quality.

Crops	Doses		Recommendations
	Soil application	Foliar application	
Horticultural crops and berries Stone and pome fruit trees and nuts Citrus and tropical crops Vines and table grapes Ornamentals Olive trees Industrial and extensive crops (cereals, rapeseed, cotton, etc.)	2-8 L/ha	7-15 L/ha	Soil application: Perform 2 to 5 applications. Make the first application before transplanting or in the first irrigation at the beginning of the crop cycle to facilitate the washing of salts and improve soil structure. Subsequently, apply according to the soil problems. A distribution of localised applications is recommended in the warmer months, where salinity problems are more prevalent once the fruit has formed. The interval between applications is 10-15 days. Foliar application: Make the first application before the onset of high temperatures. Start applications after fruit formation. Apply as necessary to maintain crop protection until harvest.
